Original Resolve: reference pictures and the agreed sections

5 November 2026. From Simeon.

These pictures come from the original Resolve design mockups (github.com/simeonfab/resolve-docs, mockups folder). They were designed for a phone screen, so treat them as a guide to the journey, the content, the tone and the look. They are not a layout spec for this desktop app. Fonts in the pictures fall back to a system serif where DM Serif Display did not load.

The sections (decided)

Global sidebar, Linear-style:

1. Home: the dashboard across all projects (picture 12 and 13).
2. Projects
3. Calendar
4. AI Team: specialists and their conversations across projects.
5. Knowledge: shared documentation and reference material.
6. Settings

Top bar on every screen: Ask Resolve (the contextual global bar, picture 20), Search, Add task, New project (opens the intake).

Inside a project, six tabs:

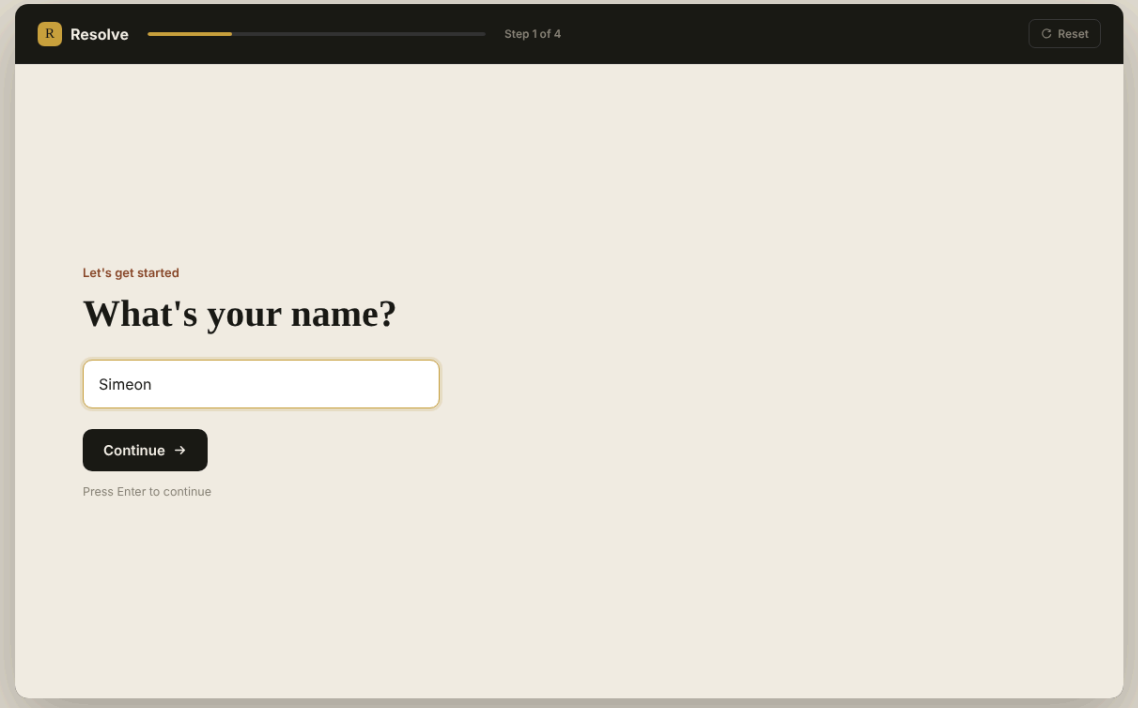

1. Overview: objective, outcome, progress, "Decide this first", waiting on, today, worth a look, recent decisions. The original dashboard idea, for one project.
2. Roadmap: Now, Next and Later, viewable by phase or by theme (picture 15), plus milestones, dependencies and validation gates.
3. Work: Now, waiting on, captured and upcoming (picture 14), with list and board views. Replaces Tasks, Inbox, Today, Upcoming and Filters.
4. Validation: the Hypothesis Zero tree, experiments, evidence, assumptions, open questions and decisions in one place. A framework switcher sits here with Hypothesis Zero first. This merges the brief's Frameworks and Evidence and Records tabs, because evidence must stay next to the hypotheses and decisions it supports.
5. Knowledge: the project brief, documents, research, and the cut list of things deliberately not being done (picture 18).
6. Team: the leads, stand-up, agent chat and Handoff (pictures 16 and 17).

01-intake-name-and-welcome

one question at a time, Enter to continue, greet by name once.

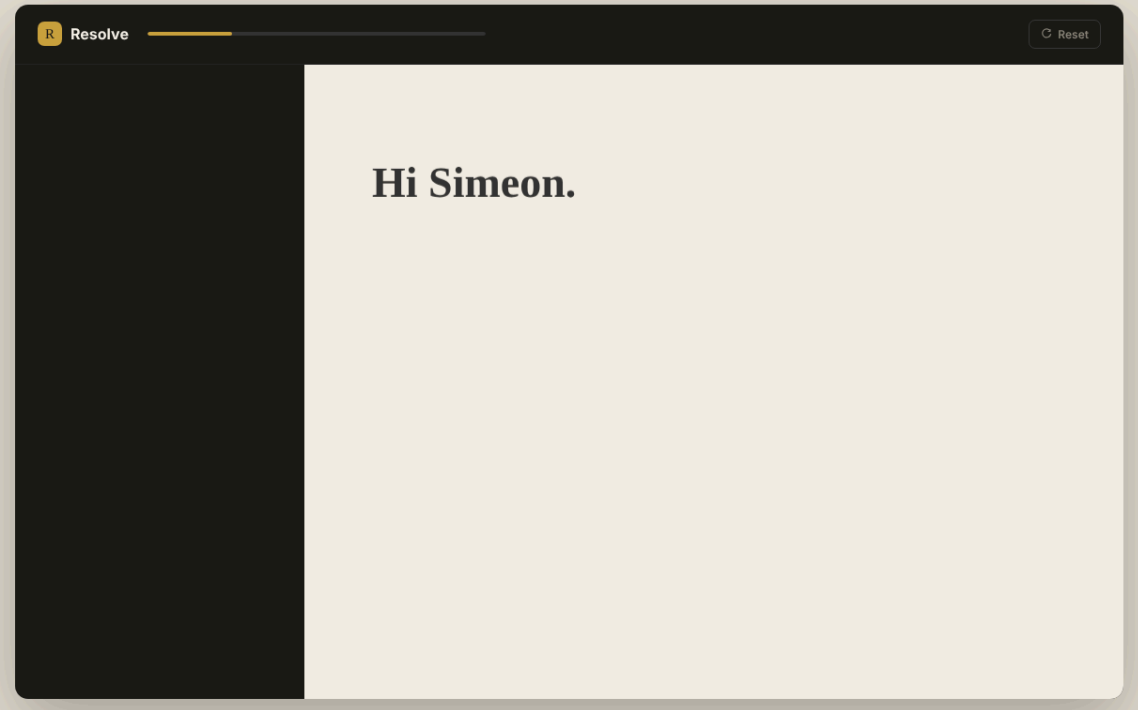

1 · Name entry

Centered to match the welcome screen. Eyebrow cleaned to sentence case. Behaviours to build in: field autofocuses, Enter submits, and Continue stays disabled until a name is typed — so the primary action is never a dead end. (Shown enabled with a name entered.)

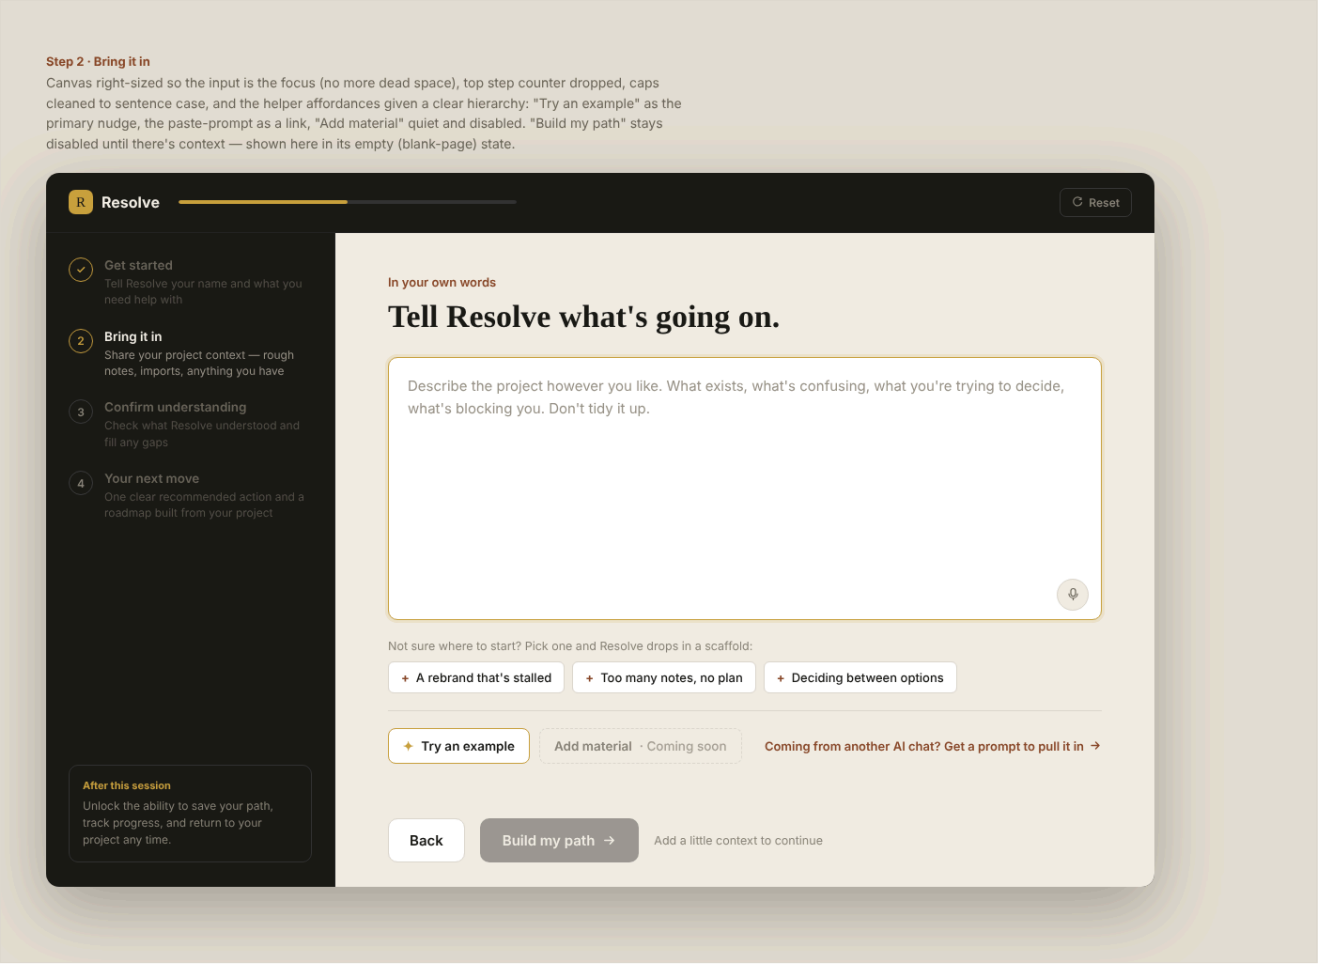

2 · Welcome → problem (fused reveal)

The delight beat and the first question are now one screen. "Hi Simeon." reveals as the serif hero and stays put; "Welcome to Resolve" gives way as the question and the three paths animate in beneath the same headline — no dead middle screen, no extra click. The top step counter is gone for this moment (the sidebar stepper is the progress now), and "Coming soon" / "After this session" are sentence case. Question is set in Inter so the screen keeps a single serif element. Loops for preview.

02-intake-bring-it-in

one big free-text box for the messy version, plus the small "pull it in from another AI" prompt.

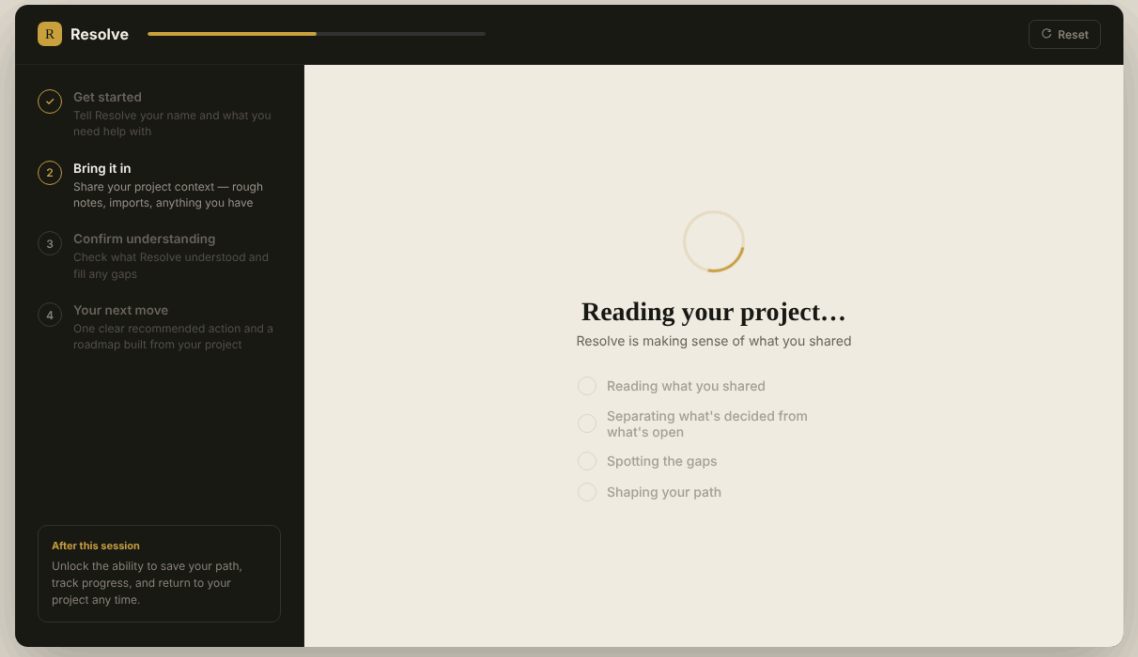

03-intake-confirm-understanding

what Resolve understood, as cards the user edits, plus gap questions.

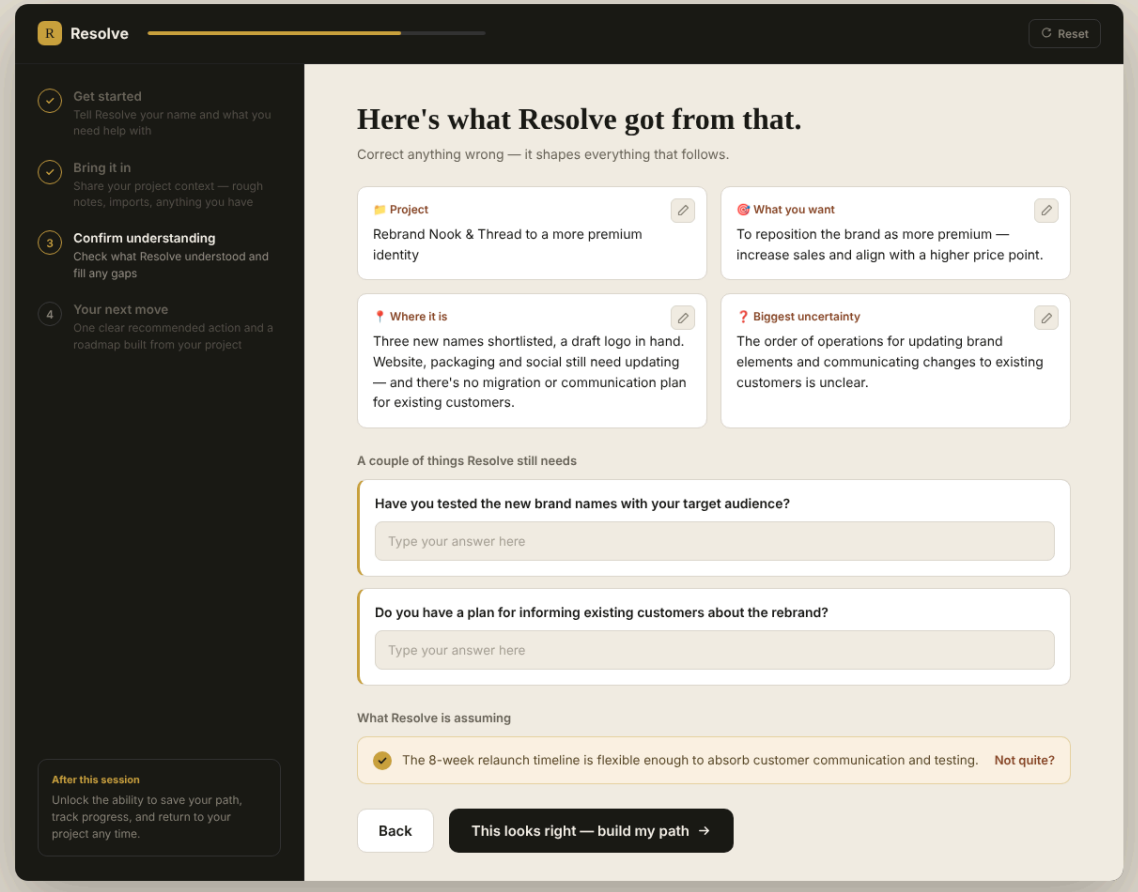

1 · Reading your project (loader)

The lone spinner now narrates the work: an amber ring plus a short checklist that ticks off what Resolve is doing — reading, separating what's decided, spotting gaps, shaping the path. It turns dead wait time into anticipation and previews the structure of the confirm screen. Loops for preview; in product it runs once through.

2 · Here's what Resolve got from that

Card labels and "After this session" cleaned to sentence case, top counter dropped, canvas right-sized. Each understanding card is now individually editable (pencil per card) rather than one shared Edit button, the assumption can be challenged inline ("Not quite?"), and the missing forward action lives in a footer.

04-intake-when-no-outcome

when there is no outcome to aim at, Resolve asks instead of guessing.

SPEC 1.3 · GATE 1 HALT + PROVISIONAL MARKING

When there's no outcome to aim at, Resolve asks. Everything else, it builds and marks honestly.

This screen now halts for **one case only**: intake captured no real outcome, so there is nothing to build toward. When the outcome is clear but the lever isn't, Resolve no longer hands the question back, working out the path between where you are and where you want to be **is the product**. It builds the roadmap and marks the inferred parts as provisional. The thesis: not just any direction. The **right** direction, with what we're confident in and what we inferred shown honestly. Because intake already asks and validates the outcome, this halt should fire rarely. Two strings come from the floor service and are marked; everything else is static copy.

Sign-in · R1 → **Gate 1 Halt · fires rarely** → Roadmap Reveal · R2

1 · Default (the halt)

Resolve

Before we build this

We're not going to guess.

You've given us real detail. What's missing is the finish line, so right now the work could lead almost anywhere.

We could draw a roadmap that looks convincing. We'd rather ask one thing than hand you a plan built on a blank.

ONE QUESTION

If Resolve does its job, what is different in three months that isn't true today?

● REASON + QUESTION COME FROM THE FLOOR SERVICE

Answer in a sentence or two.

Continue

Answering re-runs the check. It might be enough to build on, or there might be one more thing we need. No promises yet.

One case, one question, **one path, no way around it**. Register: honest, not sorry. Para 2 is the thesis, do not touch. The **one question** is the hero; input and button stay quiet beneath it. No escape hatch, with no outcome there is nothing to honestly build toward, so a provisional roadmap here would be fabrication.

2 · Filled (ready to submit)

Resolve

Before we build this

We're not going to guess.

You've given us real detail. What's missing is the finish line, so right now the work could lead almost anywhere.

We could draw a roadmap that looks convincing. We'd rather ask one thing than hand you a plan built on a blank.

ONE QUESTION

If Resolve does its job, what is different in three months that isn't true today?

In three months, Nook & Thread sells at the higher price point without losing its regulars, and we've proven it with real repeat orders.

Continue

Answering re-runs the check. It might be enough to build on, or there might be one more thing we need. No promises yet.

Input focused, primary action enabled. Nothing celebratory. The consequence line stays visible so expectations never drift toward a guaranteed roadmap.

3 · Submitting (re-running the check)

Resolve

Before we build this

We're not going to guess.

You've given us real detail. What's missing is the finish line, so right now the work could lead almost anywhere.

We could draw a roadmap that looks convincing. We'd rather ask one thing than hand you a plan built on a blank.

ONE QUESTION

If Resolve does its job, what is different in three months that isn't true today?

In three months, Nook & Thread sells at the higher price point without losing its regulars, and we've proven it with real repeat orders.

Re-running the check

Checking whether we can now see the finish line clearly enough to build. This takes a moment.

The floor re-evaluates. Same words as "re-runs the check" so the action and its label match. Input locks; nothing implies the outcome.

4 · Passed (straight into R2)

Resolve

That's the piece we needed.

Building your roadmap now.

Unchanged. Brief, then it hands straight to **Roadmap Reveal**. No confetti, no "you passed". The founder gave what was missing; they didn't clear a gate.

5 · Dynamic — the question card must flex

Resolve

The **reason** (one sentence) drives Para 1; the **question** is generated per project. Neither is the length of the example. The card must hold both without breaking.

SHORT REASON + QUESTION (~8 WORDS)

We can't tell what success looks like yet.

ONE QUESTION

What is different in three months if this works?

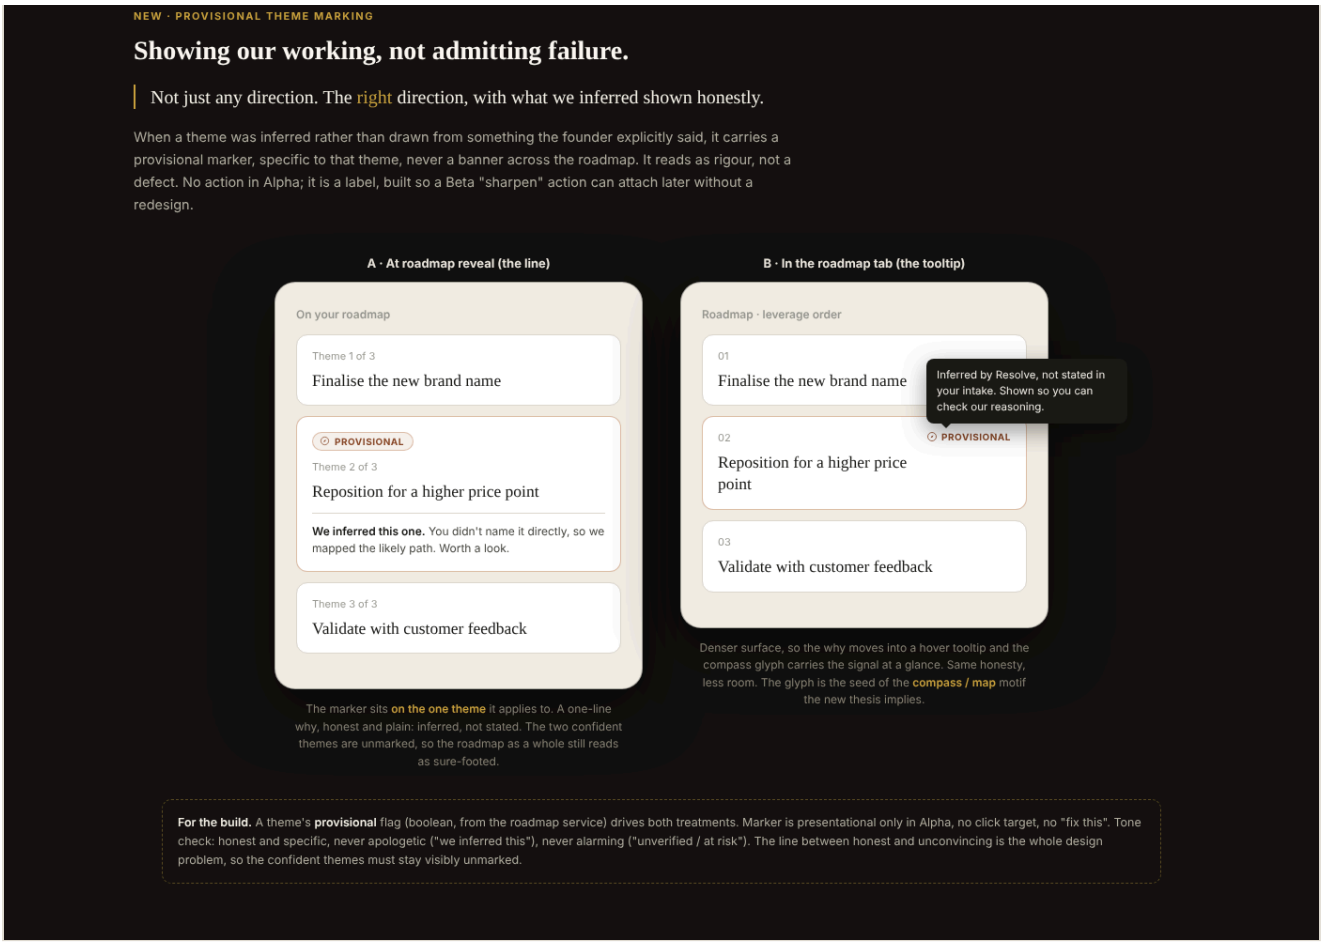

LONG REASON + QUESTION (~30 WORDS)

You've described a lot of activity, but nothing in it points to a finish line we could measure, so any roadmap we drew would just be motion dressed up as direction.

If Resolve does its job over the next three months, what specifically would be true then that isn't true today, in a way you'd actually be able to point to?

● BOTH STRINGS FROM THE FLOOR SERVICE

Same screen, two possible payloads. Build must let the card grow and the paragraph reflow. Marked strings are dynamic; everything else is fixed copy.

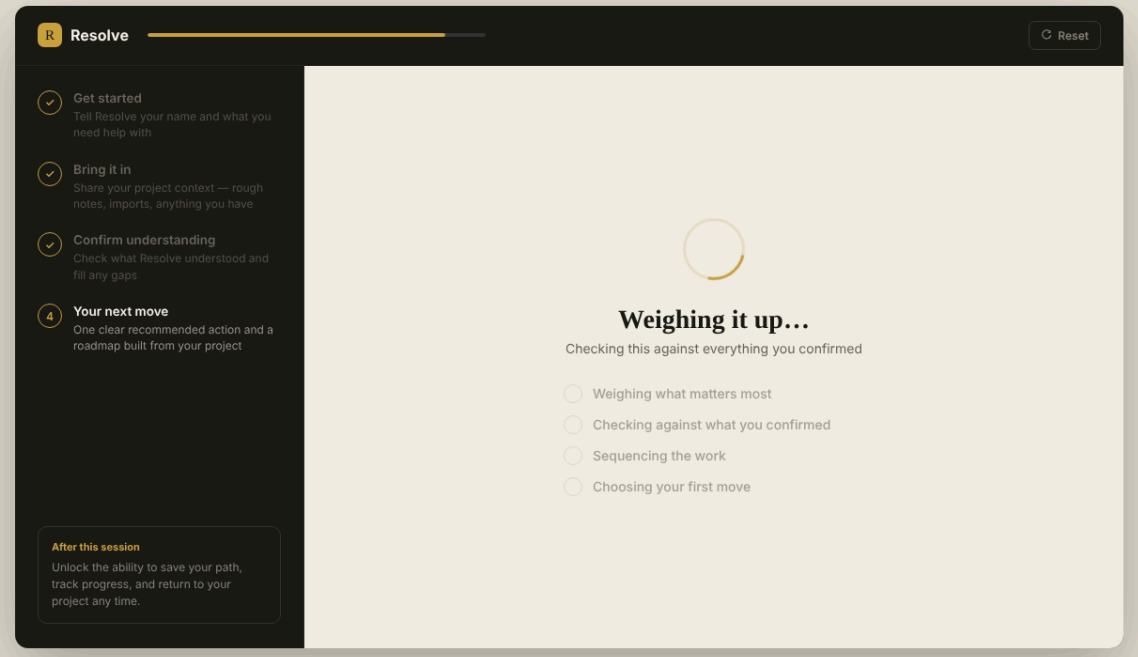

05-intake-next-move

the recommended next move.

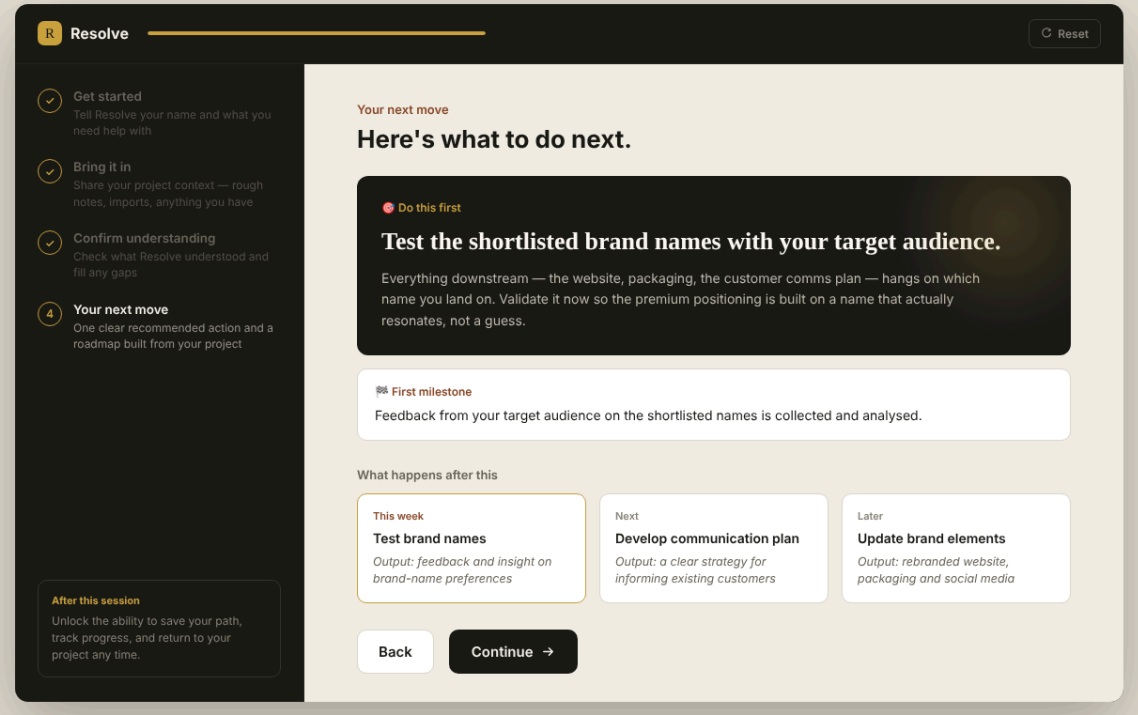

1 · Weighing it up (loader)

Second loader, same narrated treatment as the first but sequenced for this moment — it's now deciding, not just reading. The checklist previews the shape of the next-move screen: weighing priorities, checking against what you confirmed, sequencing the work, choosing your first move. Loops for preview; runs once in product.

2 · Here's what to do next

One serif element only — moved to the dark recommended-action card (the dominant moment, matching the dashboard win card); the page title is now Inter. All eyebrows cleaned to sentence case, top counter dropped, canvas right-sized, the "this week" step in the timeline flagged as the active one, and the forward action lands in a footer (leading into the celebration handoff).

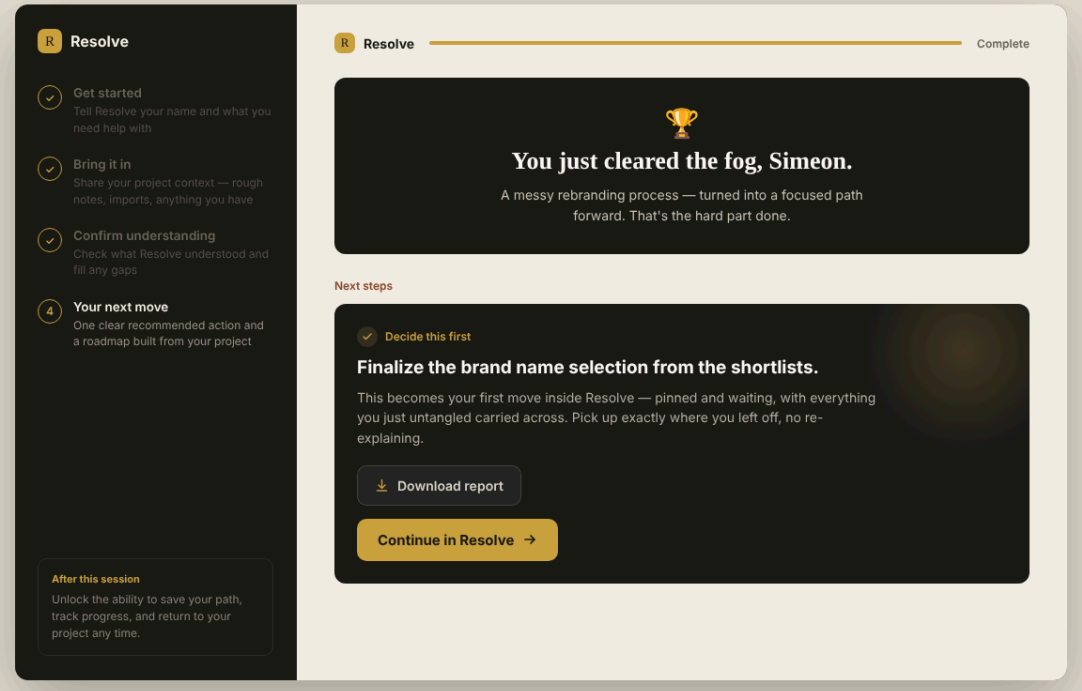

06-intake-bridge

the bridge from intake into building the project.

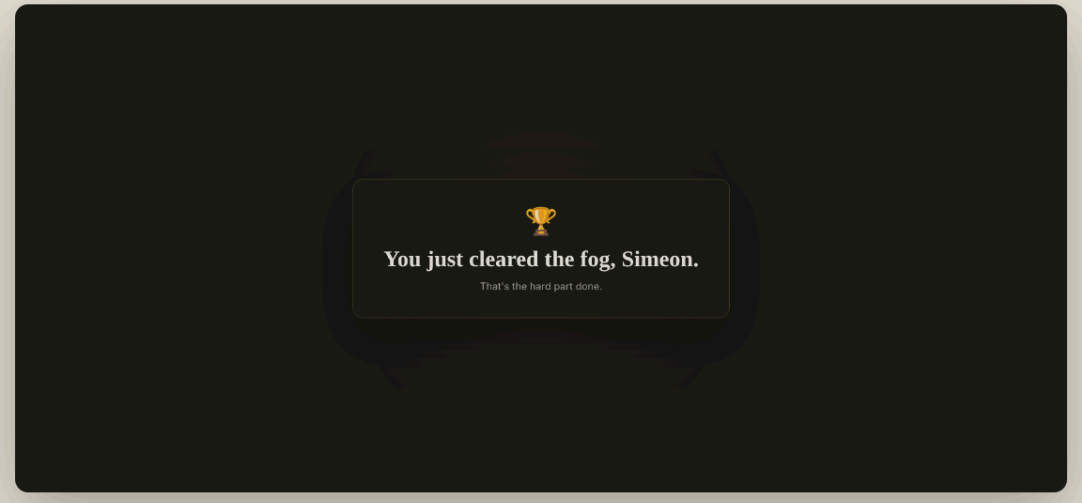

1 · Final intake screen

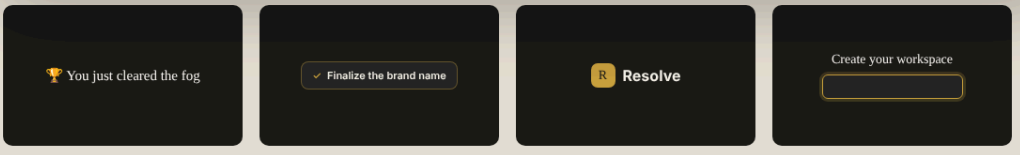

The screen ends at the handoff card — trophy box, Next steps handoff, nothing below. Inside the handoff: the carry-over pills and the "Not now" link are gone (first move is already shown here; the full roadmap is the post-transition reveal, not handed over free). Download report moves up as the single secondary button directly above the CTA and pulls the full project report. Continue in Resolve is unchanged.

2 · Bridge transition

Motion, not a static page — shown two ways: the live loop plays the real ~9s bridge (auto-runs, four held beats of ~2s each with smooth cross-transitions), and the keyframe strip below freezes each beat. Beat 1 is one continuous zoom — the trophy box already on the final screen grows to take over, no cut to a fresh screen. It stays on Ink + Amber the whole way and hands directly to the dark sign-in, so there's no dark→light flash mid-flow. **The final beat is the canonical sign-in's minimal state — dead-centre, amber glow, serif headline, brandmark, and the "Your email" field + Send code — so it is pixel-identical to R1's first frame. The eyebrow, subhead and returning-user link are not shown here; they fade in only after the real screen lands.**

0.0–2.3s — trophy zoom
The trophy box grows to take over the screen — one continuous zoom, no cut.

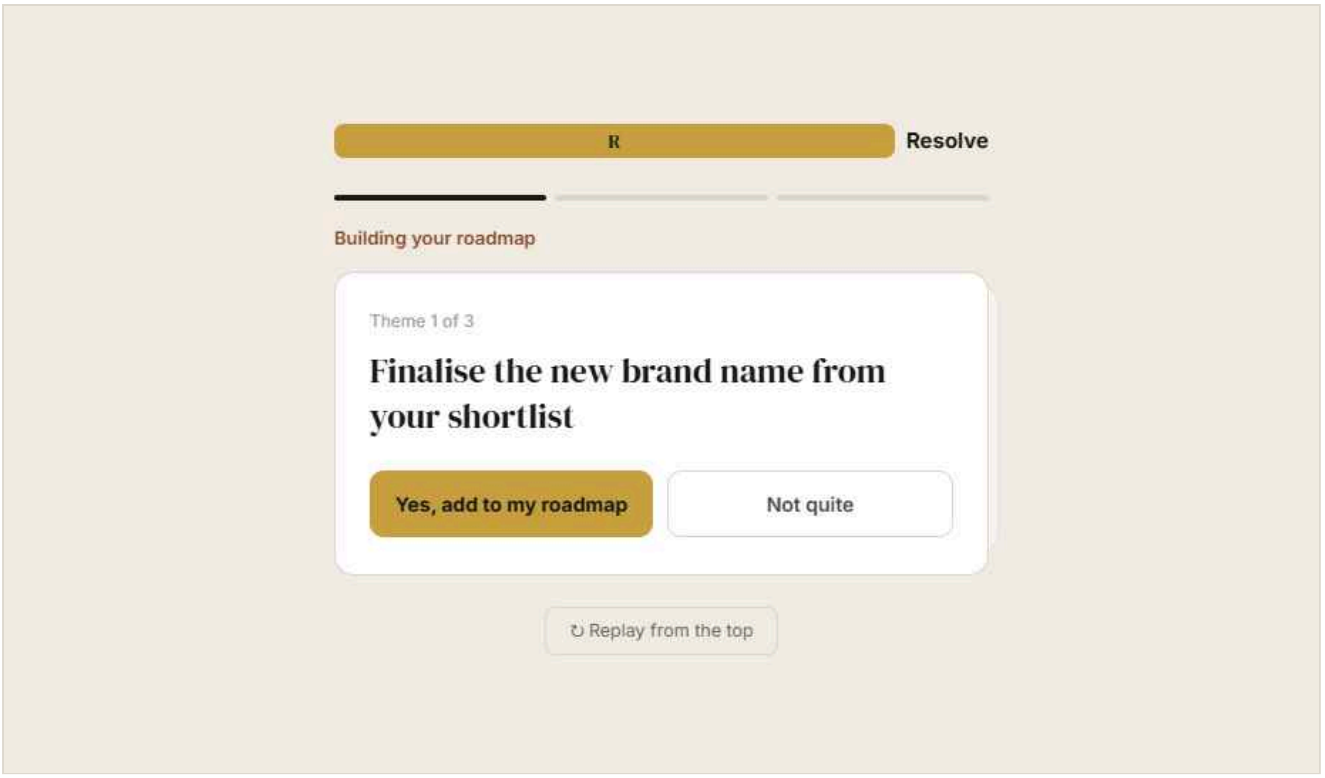

2.4–4.5s — first move pins
The user's real next task glides in — "Bringing your first move with you."

4.6–6.6s — workspace forms
Resolve mark appears; context chips fan in — "Setting up your workspace."

6.8s → holds — canonical sign-in
Minimal state, pixel-identical to R1's first frame. Eyebrow, subhead + Sign-in link fade in after landing.

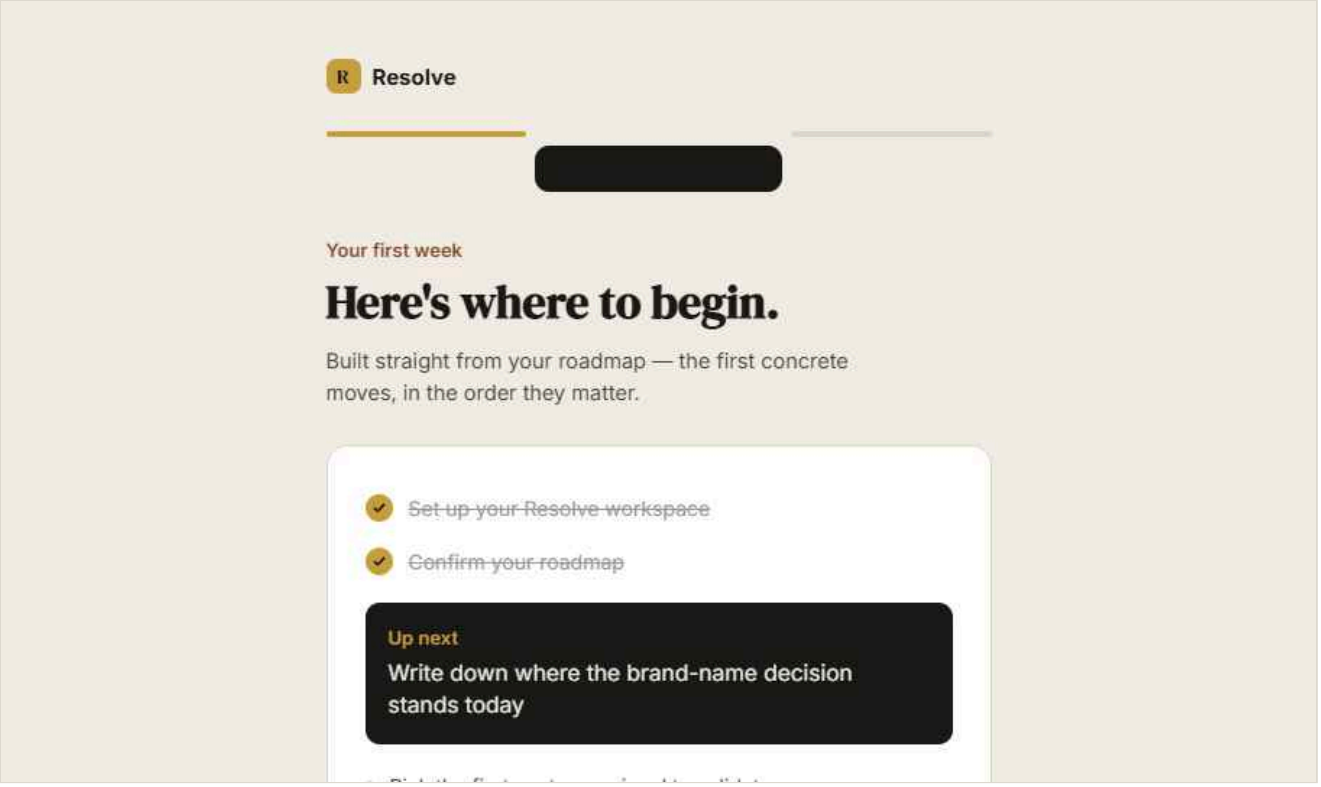

07-roadmap-theme-cards

roadmap themes confirmed one at a time.

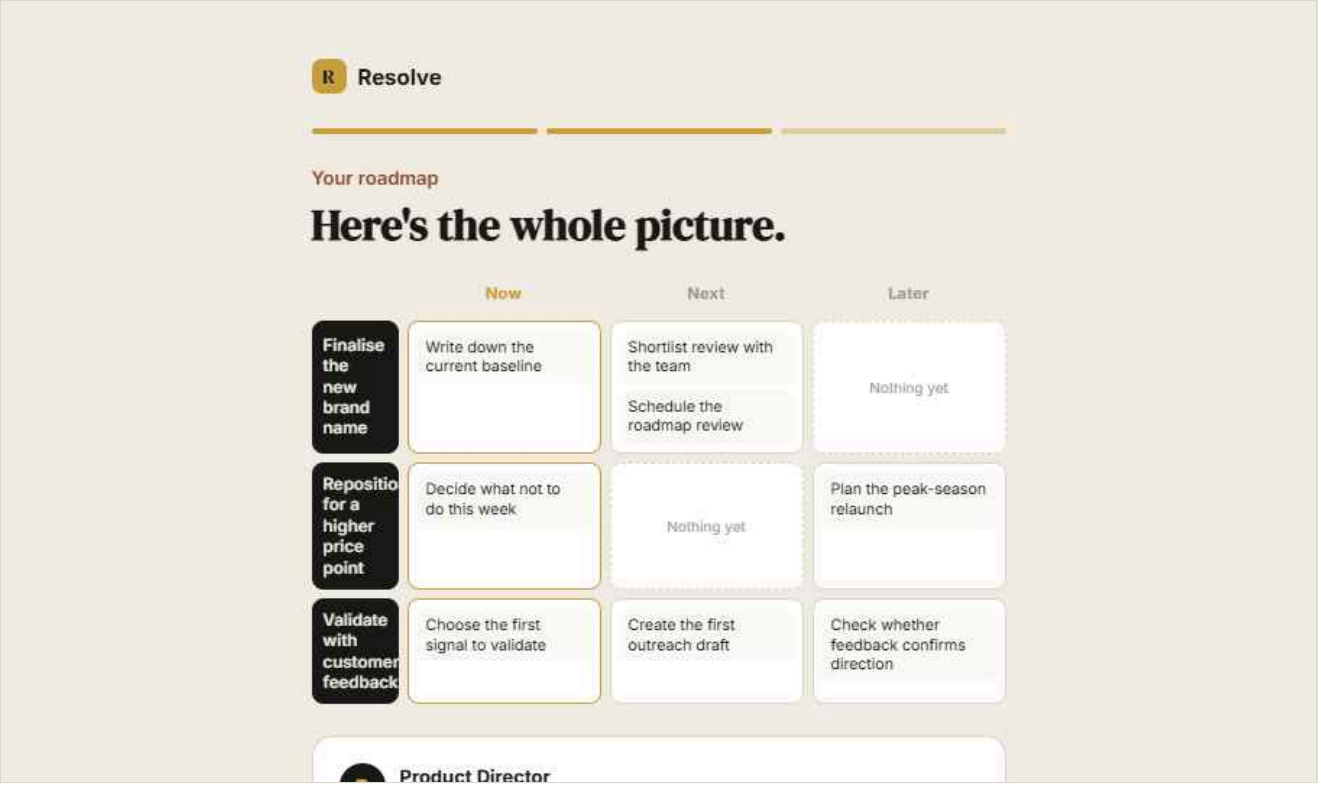

08-first-week-todo

"Here's where to begin", the first week in order.

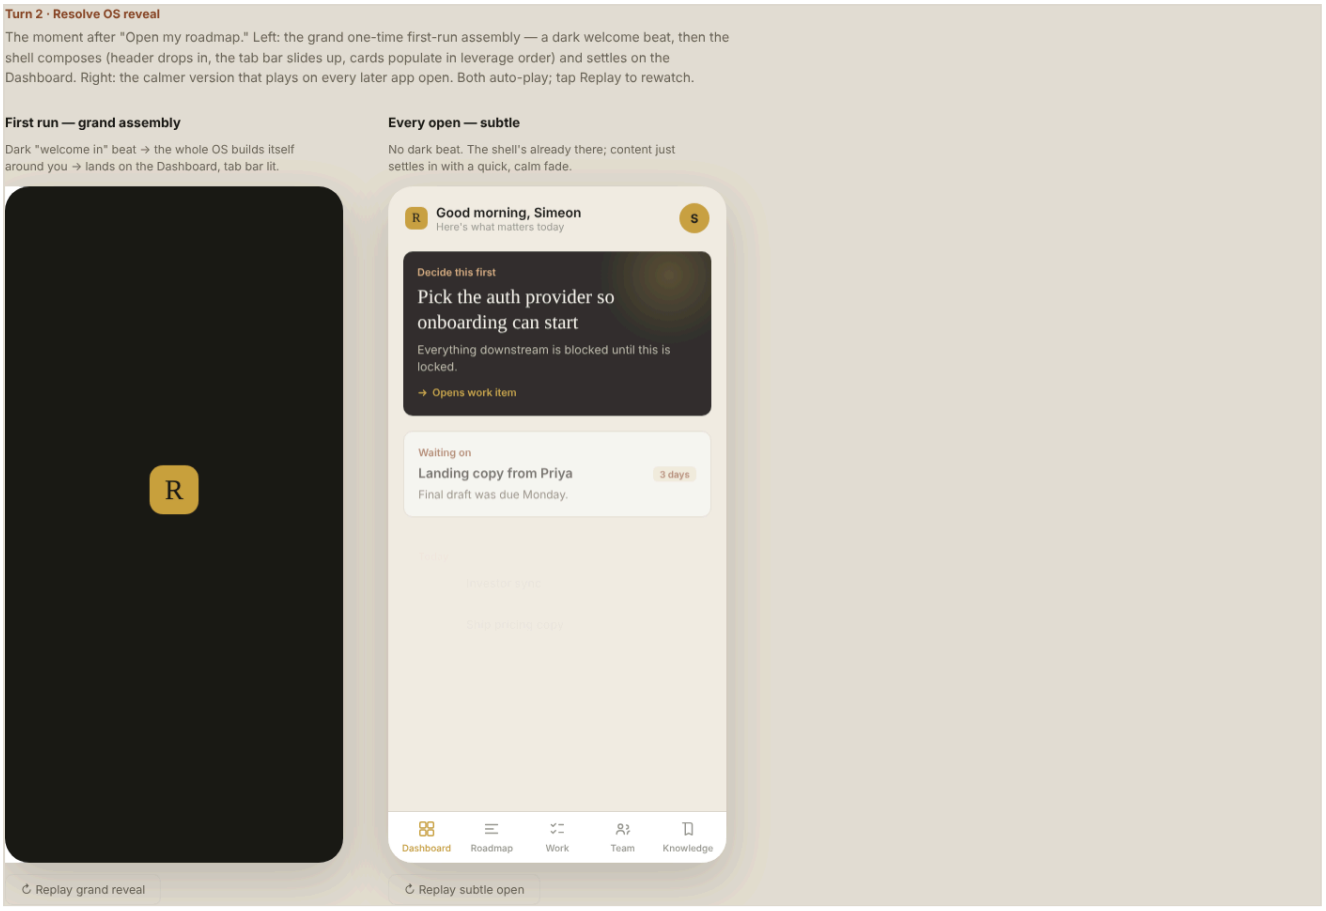

09-roadmap-reveal

"Here's the whole picture", the roadmap reveal before the app opens.

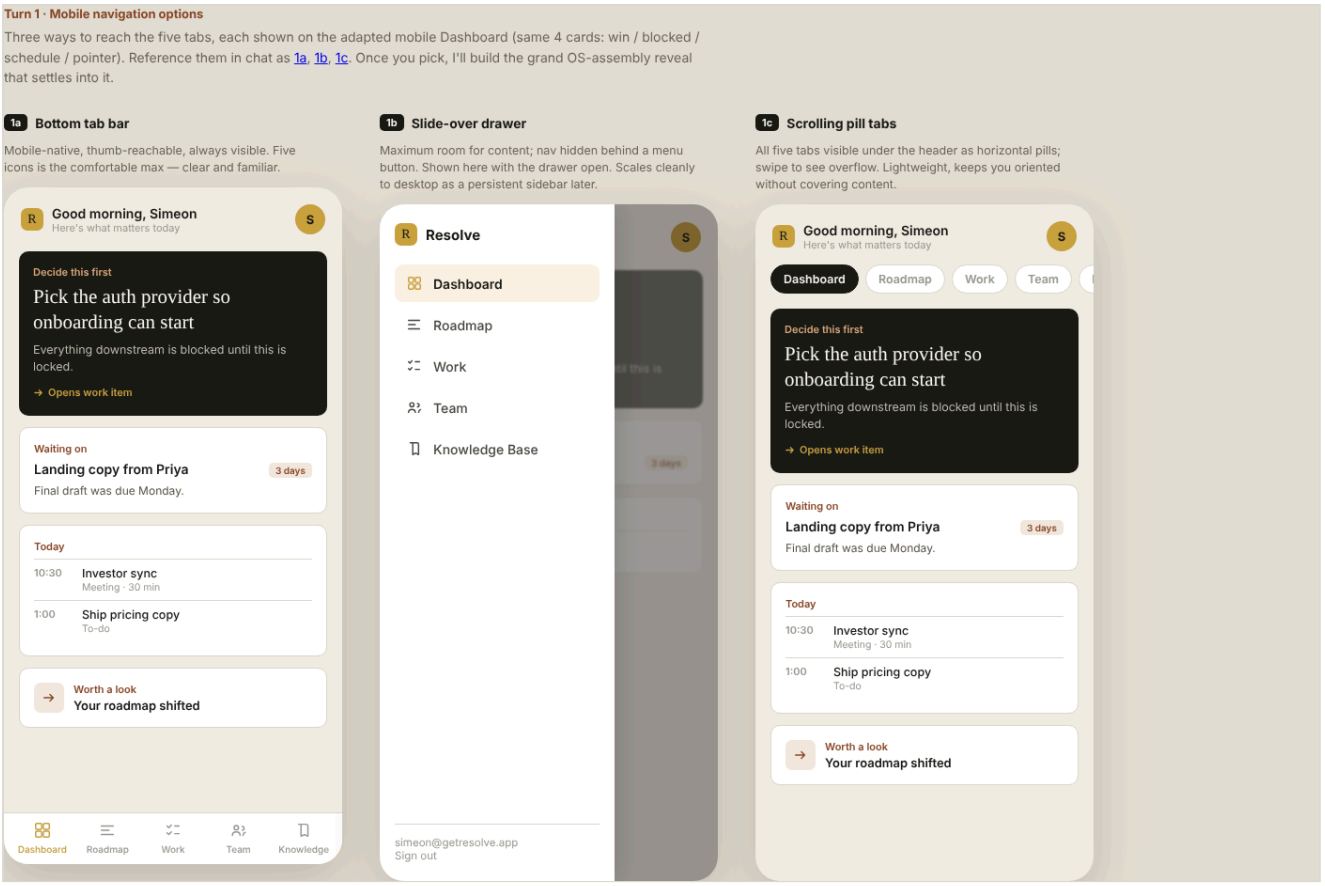

10-app-first-open

the first time the app appears after the intake.

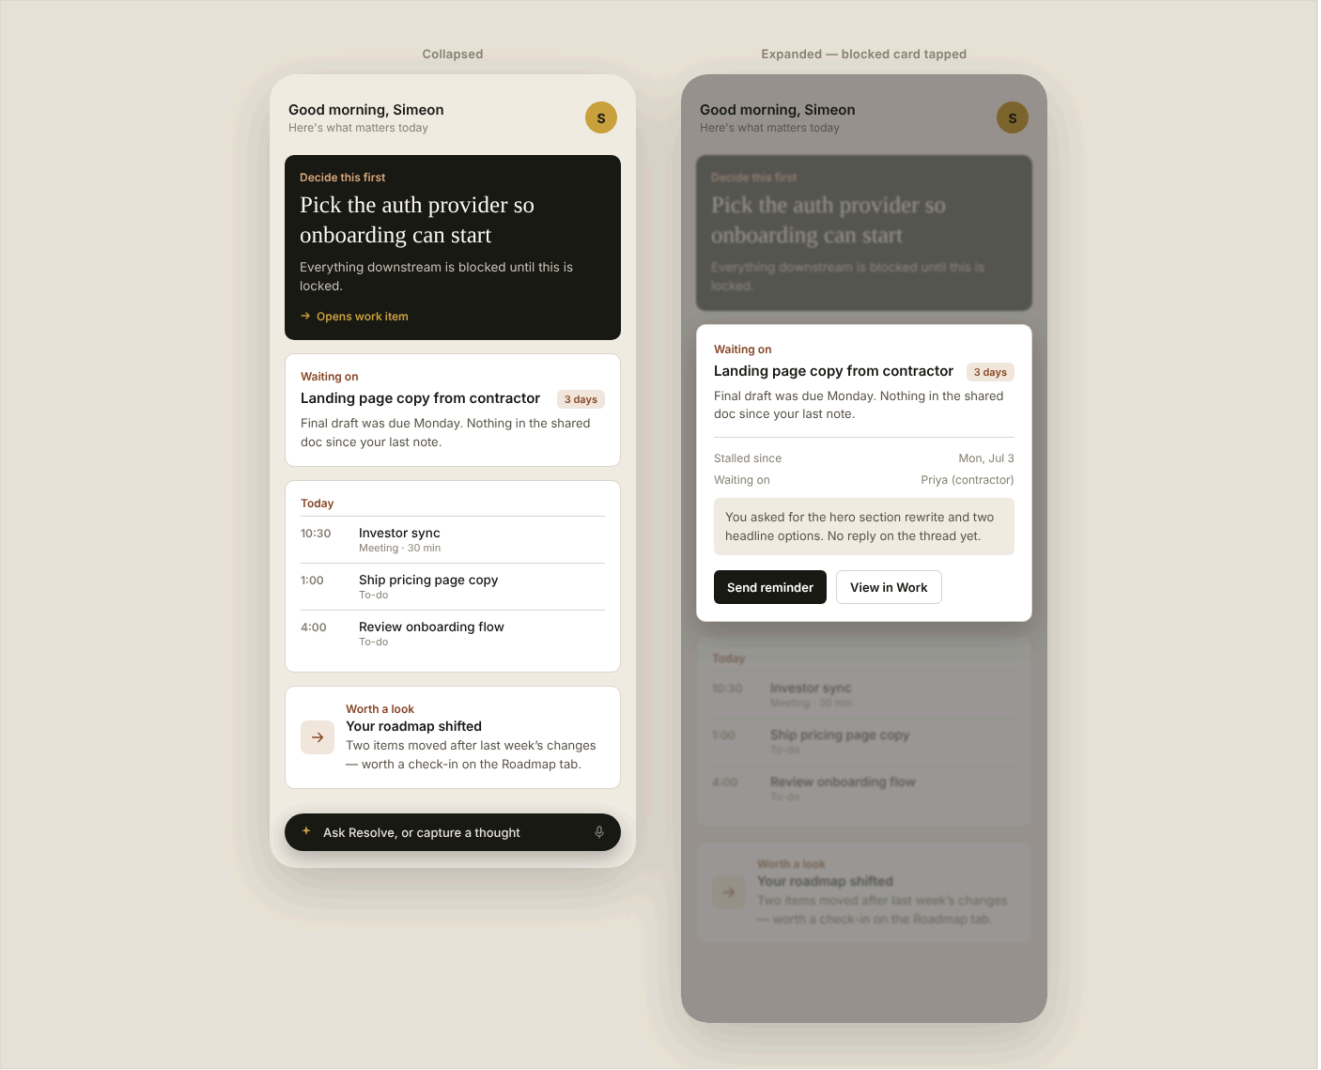

11-app-shell

the original tab structure (Dashboard, Roadmap, Work, Team, Knowledge). On desktop this becomes the sidebar plus project tabs above.

12-dashboard

"Decide this first", waiting on, today, worth a look.

13-dashboard-states

empty and populated dashboard states.

RESOLVEPM · DASHBOARD CONTENT

Give the empty dashboard a job: one move, quietly supported.

The dashboard exists to **orient the founder in ~5 seconds and point them at their single highest-value next move** — not to be a second roadmap or an analytics wall. Recommendation: **direction (a)** — a single-focus hero with a **quiet momentum strip** beneath it. Focus first; supporting context second. Below: the recommended build (live), the command-centre alternative (b) and what it costs, and the desktop-frame check.

Hero = highest-value move, live · **Momentum** = what changed since last visit · **Then this** = next in the ranked queue · **Waiting on** = stalled, surfaced not lost

★ Direction (a) — recommended

LIVE · playable

Tap **a shortlist checkbox** — the item banks into the momentum strip (proving the hero **advances as work completes**). Tap **Waiting on** to expand it in place. Hero glow breathes on idle.

Reset

Good morning, Simeon
Here's what matters today

S

YOUR HIGHEST-VALUE MOVE

Test the shortlisted brand names with real customers.

Everything downstream — the website, packaging, the comms plan — hangs on the name. Get it validated before you build on it.

- Focus theme · Finalise the brand name

Start this →

First move in this week's focus. Updates the moment you finish something.

SINCE MONDAY — 3 moved

- Confirmed your roadmap
- Wrote down the baseline
- Picked the first signal

THEN THIS — Ranked queue

- Decide what not to do this week — Reposition
- Draft the customer-comms plan — Finalise the brand name

WAITING ON — 1 stalled

Landing page copy from Priya — 3 days

Final draft was due Monday. Nothing in the shared doc since your note.

+ Ask Resolve, or capture a thought

Direction (b) — light command-centre

for comparison

Same hero, **demoted to make room** for momentum + blocked + queue shown at once. Uses the desktop real estate, but every panel competes for the eye — the "one next move" stops being obvious.

Good morning, Simeon

- Schedule the roadmap review

THIS WEEK'S FOCUS
Finalise the brand name · 1 of 6 done

What (b) costs: four panels of equal weight re-introduce the busyness the density pass removed. The eye lands nowhere first — orientation takes longer than 5s, and the hero no longer reads as **the** thing to do.

Desktop-frame check — direction (a)

recommended

The empty-desktop complaint is answered by **letting the hero earn the width** — 38px serif, generous breathing room — with momentum, queue and blockers in a calm secondary rail. No new widgets, no charts. The founder still lands on one move; the rail is glanceable context, never a competing grid.
